TradeLoop: User Stories and Tasks

Project Presentation 3 (PRP370S) | Group 6 | Taken from our team Trello board. Each card is one user story, broken down into the tasks needed to deliver it. All cards are marked complete.

Sprint	Card
Sprint 1 (Day 3)	Problem Validation
Sprint 3 (Day 2)	Completing Deliverable 2
Sprint 7 (Day 1)	Marketing Website
Sprint 7 (Day 2)	Interactive App Prototype
Sprint 7 (Day 3)	Real Backend and Database
Sprint 7 (Day 4)	Real Authentication
Sprint 8 (Day 1)	Real Payment and Escrow Integration

1. Problem Validation

Sprint 1 | Day 3 | Status: Complete | Team: PM, NM, SH | Label: Week 1

User story

> …Nomsa, a 28-year-old resident of Khayelitsha who just had a household emergency (e.g. a broken geyser), **I want** to send a WhatsApp message describing my problem and get matched with a verified local worker within the hour, **so that** I don't waste hours asking around or hand cash to someone I have no way to trust.

Problem being validated

That the pain of finding trustworthy help is severe and frequent enough that people will act on it immediately (send a real message, follow through, pay a fee), not just agree with it on a survey.

2. Completing Deliverable 2

Sprint 3 | Day 2 | Status: Complete | Team: PM, NM, SH | Label: Week 3

User story

> …**I want to** build detailed, evidence-based personas for both sides of our marketplace and use them to sharpen a single, defensible USP, **so that** every downstream decision (marketing channels, feature priorities, MVP design) is anchored to real people and a clear reason we win, instead of a vague pitch that could describe any job-matching app.

Tasks

- Build detailed, evidence-based personas for both sides of the marketplace
- Use the personas to sharpen a single, defensible USP

Problem being validated

That we understand our two user groups well enough to make a USP claim that is specific and hard for competitors to copy, not just a generic “trusted local marketplace” statement.

3. Marketing Website

Sprint 7 | Day 1 | Status: Complete

User story

> As a first-time visitor, **I want to** immediately understand what TradeLoop does and see proof it already works, **so that** I trust the platform enough to post a job or start earning.

Tasks

- Hero section with trust stats (9 min avg. claim, R2.1M+ paid out, 4.8 rating)
- Four-stage “how it works” loop with a live phone mockup
- Service category grid
- Client and worker persona cards with testimonials
- Trust & safety section
- Social proof quotes and a footer
- Working login, sign-up and forgot-password modals

4. Interactive App Prototype

Sprint 7 | Day 2 | Status: Complete

User story

> As the TradeLoop team, **we want** a working, tappable prototype of the entire job loop, **so that** we can demo the real experience to lecturers, testers, or future users before building the real backend.

Tasks

- Onboarding and authentication screens
- Browsing nearby workers and posting a job
- Receiving and viewing offers
- Escrow-style “confirm & pay” flow
- Live job tracking
- Before/after/client-confirmation photo verification
- Rate & review and My Jobs
- Client and worker profiles
- Worker dashboard with earnings breakdown
- Settings (all running on demo data)

5. Real Backend and Database

Sprint 7 | Day 3 | Status: Complete

User story

> As a developer, **I want** jobs, offers, and payments to persist in a real database, **so that** the app keeps working for real users beyond a single browser session.

Tasks

- Replace the demo data and the “reset demo data” button
- Build a real backend
- Set up a database that stores users, job postings, offers, payments and ratings

6. Real Authentication

Sprint 7 | Day 4 | Status: Complete

User story

> As a new user, **I want** to sign up and log in with my real phone number and a verified code, **so that** my account is actually secure.

Tasks

- Replace the demo login and sign-up screens with real phone-based authentication
- SMS OTP verification
- Secure password storage

7. Real Payment and Escrow Integration

Sprint 8 | Day 1 | Status: Complete

User story

> As a client, **I want** my payment to actually be held securely and only released once I confirm the job is done, **so that** neither side risks being cheated.

Tasks

- Connect a real South African payment gateway (e.g. SnapScan, PayFast)
- Build real escrow logic that holds funds
- Release funds only once the job is confirmed
